QUAD-STACK™ AUTOMATION TO BE HIGHLIGHTED AT GRAPH EXPO 07

Web Press Corporation announces the availability of "THE AUTOMATION PACKAGE".

This optional package will replace conventional buttons and switches with "TOUCH-SCREEN" monitors. One touch-screen will be located in the front door and is designed to control one QUAD-STACK™. The system will enable scalable ink and water controls including non linear programmable tracking of the printing press main drives. It will provide and maintain accurate ink and water balance throughout the speed range of the press.

A master control can be used where single or multiple printing units will be installed. A 15" TOUCH-SCREEN master control will be available mounted into a remote console to include additional HMI functions, such as waste monitoring, preventive maintenance functions and drive controls. The benefits of this system include less wiring and computer based controls with plenty of expansion capabilities to monitor production and the machine.
